

Algebraic Graph Theory

Algebraic graph theory is a branch of Mathematics that studies graphs by using algebraic properties. There are two main connections between graph theory and algebra. These arise from two algebraic objects associated with a graph: its adjacency matrix and its automorphism group. In this course, more in particular, we focus on the spectral graph theory that studies the relation between graph properties and the spectrum of the adjacency matrix and the Laplacian matrix.

This is a graduate course. Students are expected to be familiar with basic aspects of graph theory, linear algebra and group theory. The course will mostly be taught in the lecture format, although questions are always welcome and all students are supposed to have a seminar during the semester. There will be homework assigned in each session, two exams during the semester and a final project.

Time: Monday and Wednesday, 10-12 a.m. in Az. AMAR Math. Dept.

Instructor: Behnaz Omoomi

Grade: 20% Homework + 80% Exams + Class Activities

Syllabus:

- Matrices associated to a graph
- The spectrum of a graph
- The spectrum of some graphs
 - The complete graph
 - The complete bipartite graph
 - The cycle
 - The path
 - Line graphs
 - Cartesian products
 - Strongly regular graphs
- The spectrum of an undirected graph
 - Regular graphs
 - Complements
 - Walks
 - Diameter
 - Spanning trees
- Characterization by spectra
 - Cospectral graphs
- Structure and one eigenvalue
 - Star complements
 - Graphs with least eigenvalue -2
- Spectral techniques
- Spectrum and graph structure
 - Automorphisms and eigenspaces
 - Distance regular graphs
- Laplacian
 - Laplacian spectrum
 - The matrix-tree theorem
 - Algebraic connectivity
 - Laplacian eigenvalues and graph structure
 - Expansion
- Graph automorphism
